CB-26P Fitting position

Alfa 164 3.0 V6 Cloverleaf

Simon kindly gave us a fitting picture on his Alfa 164 and some comments on PowerBoost - he said

"I've completed the "Ecoteking" of my Alfa 164 3.0 V6 Cloverleaf. I know that my particular engine is in excellent shape because I have it regularly fettled by an Alfa specialist here, and it's always been a willing and gutsy performer, but I must say that after giving it the PowerBoost treatment yesterday I was amazed at just how free revving it became, and the performance was astonishing; it certainly unleashed more horses, or woke up ones that had gone to sleep!

Having PowerBoosted, I then set about fitting the twin CB-26P's to the vacuum take-off that we decided upon earlier. A very simple job actually, and I then tuned the filters according to your instructions.

Notwithstanding my earlier reservations about the size of the vacuum pipe, I went and measured it today and found it to be 4 1/2mm which I believe is ideal. In case you want to use my installation as an example on your website, I've attached the finished "after" photo."
